A: The information here is accurate, but there are a few bugs with it. The 32-bit driver, specifically the one for the 10/100 WLAN adapter, cannot be installed. A 64-bit compatible driver can be used, though. If you wish to install the 32-bit driver, you would have to install the appropriate 64-bit driver for the

10/100 WLAN adapter first. The WLAN adapter has working drivers for Windows XP (SP2 and up) and Windows 7 (64-bit) and Windows 8/8.1 (64-bit), but the installation of the drivers for Windows 7 x86 32-bit is pretty flakey. However, as stated, these can be installed if you install the 64-bit compatible driver for the WLAN adapter first. The wireless adapter is compatible with a wide range of devices. Drivers for Windows XP (SP1 and up) and Windows 7 (64-bit) should work

fine. Clonal propagation and transplantation of murine mastocytoma cells. A murine mastocytoma variant, designated MCTC42, was cloned by a two-step selection method using the microwell cloning and the T-cell-depleted spleen colony-forming unit assay systems. Spleen colony-forming units, as a first step, were stimulated by antigen and then were treated with T-cell-depleted spleen cells. Antigen stimulated spleen colony-forming units were two times more sensitive to T-cell

depletion than unstimulated spleen colony-forming units. Clonal propagation of mastocytoma cells was obtained by two subcloning procedures in soft agar. The subcloning efficiencies from the microwell cloning and the T-cell-depleted spleen colony-forming unit assay systems were 8.5% and 24.8%, respectively. The clonal propagation efficiencies of mastocytoma cells obtained from the two subcloning systems were less than that (46.1%) of NFS-60 cells. The MCTC42 cells in the

subclones were heterogeneous, but subclones were single or double color clones. The MCTC42 cells transplanted into the spleen of syngeneic BALB/c mice grew with no signs of autolysis. The MCTC42 cells were easier to maintain in subclones than other mastocytoma cells. Further, the MCTC
